

ABSTRACT OF THE DISCLOSURE

An improved method and apparatus for the cutting of inside 90-degree corners such as cabinet lining, wallpaper and the like is provided. The invention fits snugly into a 90-degree corner, and an internally contained razor blade depresses enough to cut the paper product desired. Sheet, film, or foil material is positioned or applied over the corner. The cutting device is then inserted firmly into the corner, and slide button 24 slid along a track in order to cut the paper the full length of the cutting device. If the length of the desired cut should exceed the cutting length of the device, the device can simply be moved, and the process repeated until the full piece of paper is cut.
